

RootGen Graphical User Interface (GUI) Overview

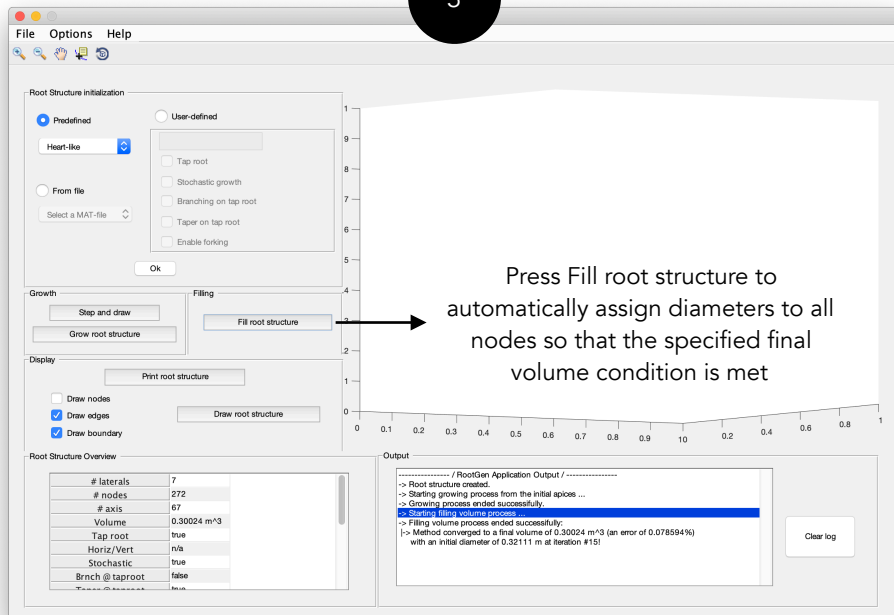

1

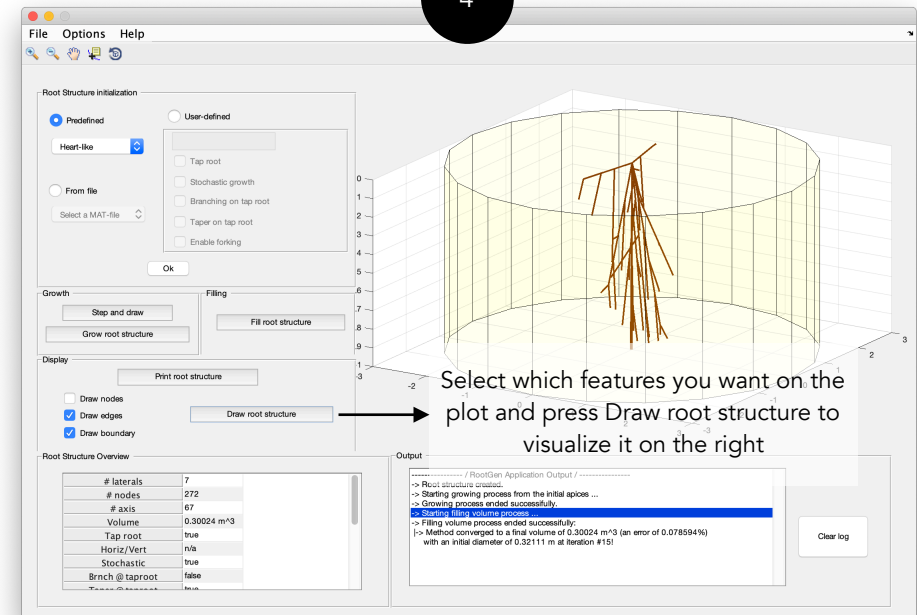

2

3

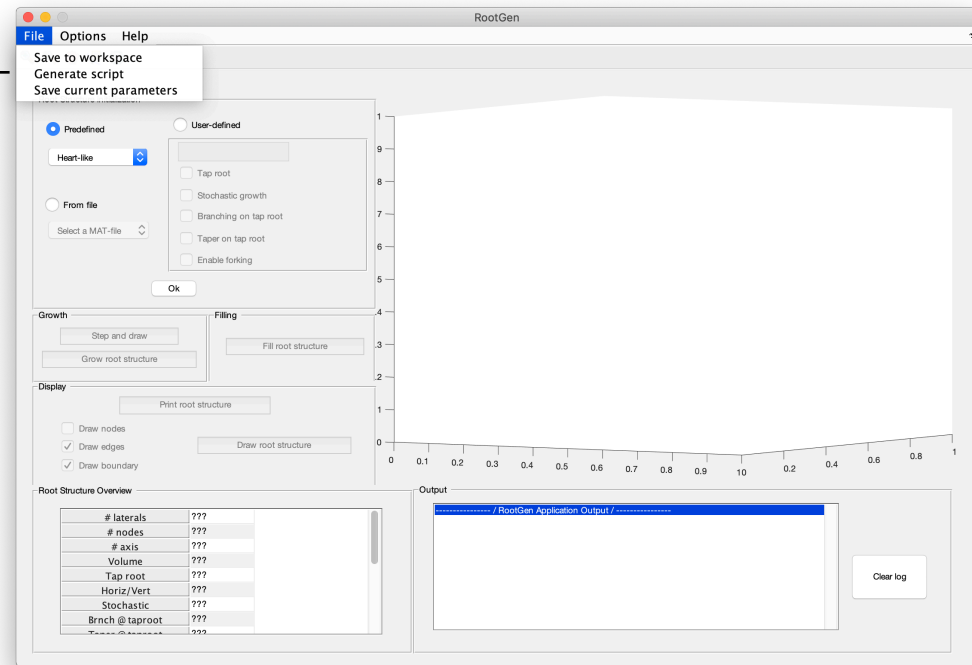

4

Save to workspace: exports the RootStruct object as a variable in the Matlab workspace environment for testing or debugging;

Generate script: after filling the root structure, it opens a secondary GUI for entering the simulation parameters for generating automatically a python script that imports the model to Abaqus software;

Save current parameters: exports the current root structure parameters as a MAT file to the folder parameters/saved;

Opens a secondary GUI to customize other parameters different from those in this GUI. Note that it can only be changed if the parameter source in the Root Structure Initialisation is "User-defined"
